Supplementary Figures

Mechanistic learning to predict and understand minimal residual disease in acute lymphoblastic leukemia

Sadegh Marzban, Mark Robertson-Tessi, Jeffrey West

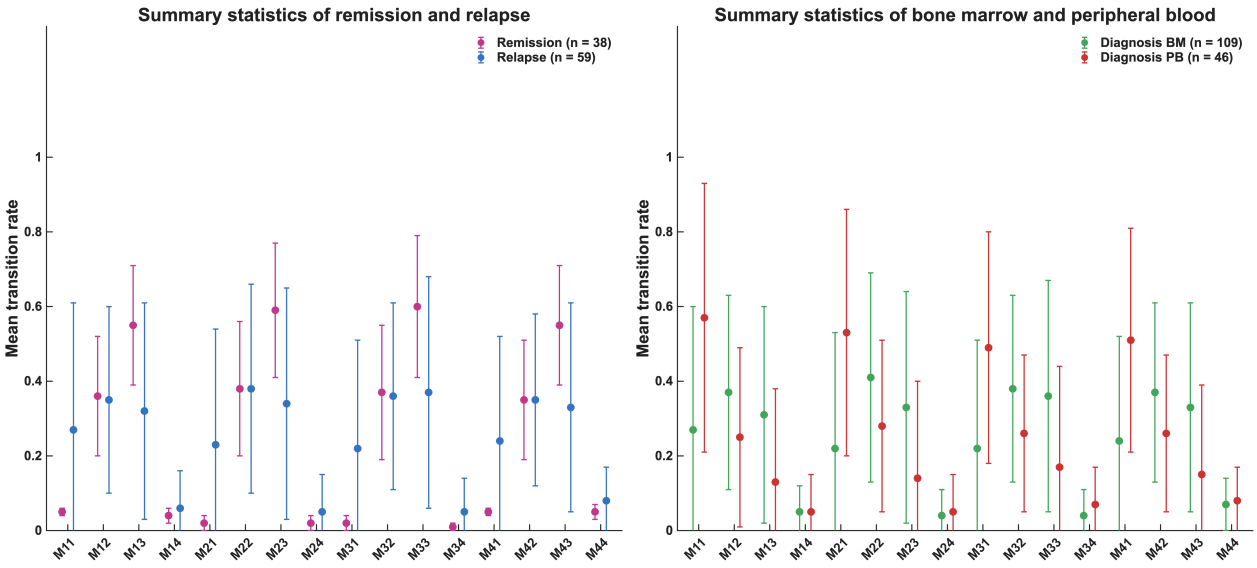

Figure S1:

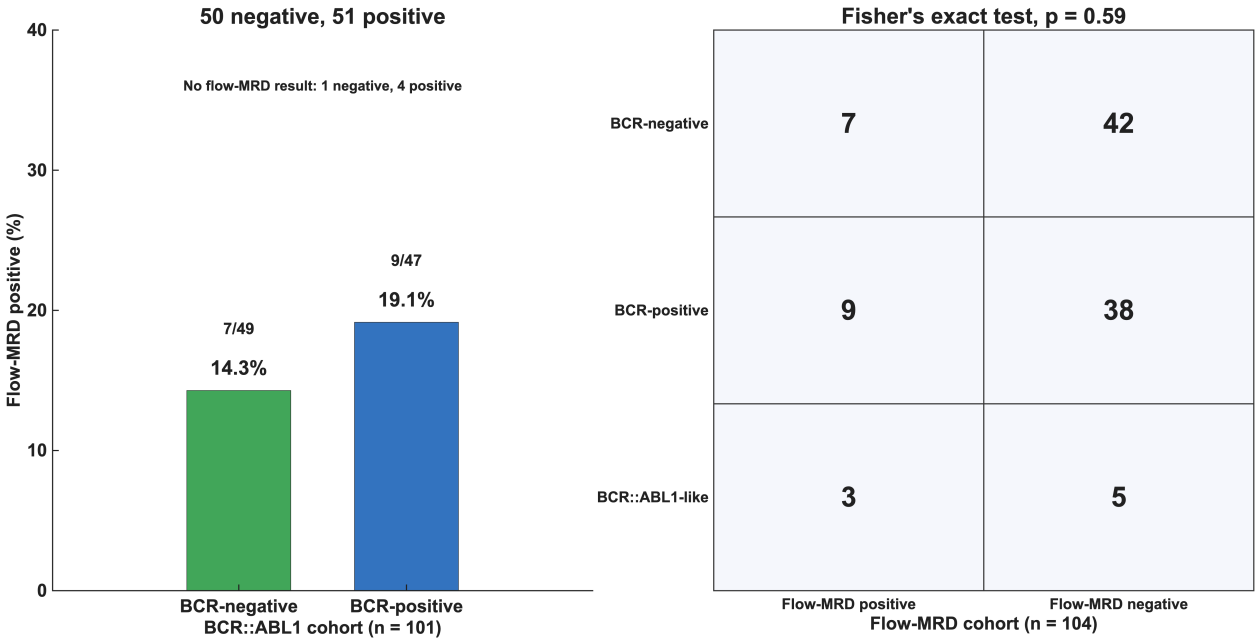

Figure S2: Counts of specimens by BCR::ABL1 fusion status and post-induction MRD status. Fisher's exact test did not detect a statistically significant association between the outcomes in this cohort.

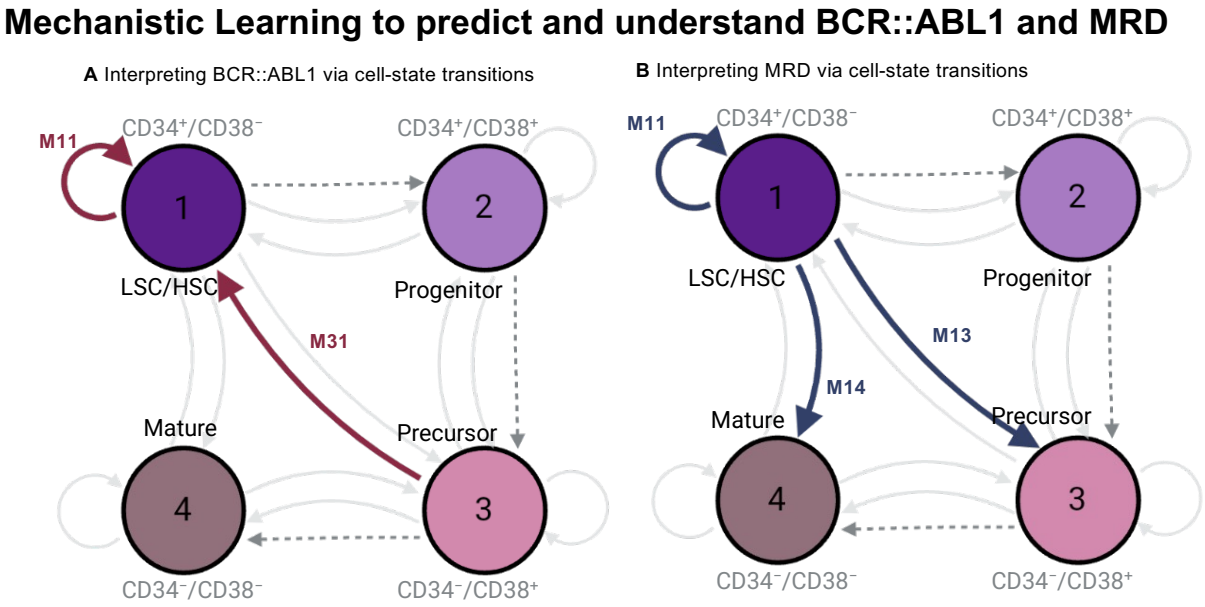

Figure S3: Four CD34/CD38-defined phenotypic states and the Markov model-inferred transitions most frequently selected as predictive features for BCR::ABL1 fusion status and post-induction MRD.
